

QHYCCD

Light Speed Vision (Beijing) Co., Ltd.

October 17, 2017

Dear QHY Dealer:

You may have heard the rumors about the new QHY 35mm format cameras. The 24 Megapixel QHY126C and 36 Megapixel QHY367C cameras have been sent out for beta testing for some weeks and there has been some discussion on the user groups. We are now pleased to announce they are ready for shipping!

QHYCCD has listened to its customers and dealers and as a result a great deal of new engineering has been expended on these cameras addressing issues of importance to the user. As a result, they represent new levels of achievement in design and usability.

We have already received a great deal of interest in these new 35mm format models and we believe they are superior to any other similar models currently available for reasons stated in our information sheet (attached pdf). To ensure your customers are among the first to receive the model of their choice, we recommend that you place stocking orders with us as soon as possible.

The innovative, low noise design is aimed at both mid-level and advanced amateur astronomers. Unlike some other CMOS cameras, these models show no amplifier glow no matter how long the exposure, and the dark current noise is reduced below levels achieved in competitor's cameras. The cameras can take exposures as short as 60us and can produce multiple frames per second in full frame, high resolution mode.

Recognizing that many astronomers begin imaging with DSLR's and video cameras, QHYCCD is pleased to offer these cameras based on sensors found in the top consumer cameras in the world. No other product offers such comprehensive high-performance capability for wide field, deep space, and planetary imaging.

To introduce these cameras to the amateur imaging community, QHYCCD is offering the QHY126C at a special price through the end of the year 2017.

We have created several items to help support you launching this product. From the Dealer Support Section of our web site, or at this link:
